Test Cases

Application Overview 1

This project has been created with the primary objective of performing **comprehensive manual testing** on the Petstore demo web application. The purpose of this testing initiative is to evaluate the application's functionality, usability, and overall behavior from an end-user perspective, ensuring that it meets the expected business and quality requirements.

The Petstore demo web application provides users with the ability to **browse a variety of pet-related products**, view detailed product information, and navigate through different categories in a user-friendly manner. Users can select desired items, **add products to the shopping cart**, modify quantities as needed, and proceed through the checkout process.

As part of this project, manual testing will be conducted across multiple testing areas, including **functional testing, validation testing, negative testing, and basic user flow verification**. Key functionalities such as product listing, cart management, checkout workflow, and user interactions will be thoroughly tested to identify any defects, inconsistencies, or usability issues.

The overall goal of this project is to ensure that the Petstore application delivers a **stable, reliable, and seamless user experience**, while identifying potential defects early and maintaining high-quality standards throughout the testing lifecycle.

C38	Application Overview

Test Environment Setup 1

Application URL: <https://petstore.octoperf.com>

Browser: Google Chrome

Operating System: Windows

Testing Type: Manual Testing

ID	Title
C39	Test Environment Setup

Test Scope Definition 1

- In Scope:
- Browse pet categories
 - View product details
 - Add to cart

- Checkout process

Out of Scope:

- Performance testing

- Security testing

ID	Title
C40	Test Scope

Test Strategy 1

Manual functional testing will be performed.

Smoke testing will be executed before full testing.

Defects will be logged manually.

C41	Test Strategy

Assumptions and Risks 1

Assumptions:

- It is assumed that the Petstore demo web application will be continuously available and accessible throughout the testing period without any unplanned interruptions that could impact test execution activities.
- A stable and reliable internet connection is assumed to be available during the entire testing cycle to ensure uninterrupted access to the application and testing tools.
- The test environment is assumed to be configured correctly and remains consistent during the testing phase to avoid discrepancies in test results.
- Required access credentials, test data, and system permissions are assumed to be provided in a timely manner to support smooth test execution.

Risks:

- Since the application under test is a demo site, there is a risk of unexpected downtime or limited availability, which may delay test execution and impact planned timelines.
- Test data on the demo environment may be reset or modified without prior notice, potentially affecting executed test cases, defect reproduction, and retesting activities.
- Changes to the demo application without formal communication may lead to test failures or inconsistencies in test results.
- Dependency on external factors such as network instability or server issues may pose additional risks to uninterrupted testing.

Appropriate mitigation steps will be considered, such as maintaining test execution backups, capturing evidence promptly, and communicating risks proactively to stakeholders to minimize potential impact on project delivery.

Browse Categories 6

This section is dedicated to validating the **category browsing functionality** of the Petstore demo web application. The primary objective of this testing focus area is to ensure that all available pet categories are correctly displayed on the homepage and are easily accessible to users.

Key goals of this testing section include:

- Verifying that every pet category available in the application is displayed accurately on the homepage or main navigation menu.
- Ensuring that users can navigate seamlessly between different categories without encountering broken links, missing items, or unexpected errors.
- Confirming that each category page loads correctly and displays the relevant products associated with that category.
- Assessing the overall usability and intuitiveness of the category browsing workflow to ensure a smooth and user-friendly experience.

By thoroughly validating the category browsing functionality, this testing effort helps ensure that users can efficiently locate and explore products within the application, supporting a positive and consistent user experience and reducing the likelihood of navigation-related defects during execution.

ID	Title
C43	TC-1: Verify all pet categories are displayed on homepage
C44	TC02: Verify user can navigate to Bird category page
C45	Tc03: Verify user can navigate to Reptile category page
C46	Tc04: Verify user can navigate to Cat category page
C47	TC05: Verify user can navigate to Dog category page
C48	TC06: Verify user can navigate to Fish category page

View Product Details 5

This section validates the product detail functionality of the Petstore demo web application. It ensures that users can access detailed information about individual products by selecting them from category listings.

ID	Title
C49	TC-VPD-01: Verify user can open product details page
C50	TC-VPD-02: Verify product name is displayed correctly

C51	TC-VPD-03: Verify product description is displayed
C52	TC-VPD-04: Verify product price is displayed correctly
C53	TC-VPD-05: Verify navigation back to category page from product details

Add to Cart 6

This section focuses on validating the add-to-cart functionality of the Petstore demo web application. It verifies that users can successfully add selected products to the shopping cart from product detail pages.

ID	Title
C54	TC-ATC-01: Verify user can add a product to cart
C55	TC-ATC-02: Verify cart displays correct product after
C56	TC-ATC-03: Verify product quantity defaults to one when added to cart
C57	TC-ATC-04: Verify user can add multiple products to cart
C58	TC-ATC-05: Verify cart item count updates after adding product
C59	TC-ATC-06: Verify cart contents persist after navigation

Update Cart 4

This section validates the cart update functionality of the Petstore demo web application. It ensures that users can modify product quantities and that cart totals are updated accordingly.

ID	Title
C60	TC-UC-01: Verify user can increase product quantity in cart
C61	TC-UC-02: Verify cart total price updates after increasing quantity
C62	TC-UC-03: Verify user can decrease product quantity in cart
C63	TC-UC-04: Verify cart total updates after decreasing quantity

Checkout Process 3

This section focuses on validating the checkout process of the Petstore demo web application. It ensures that users can proceed from the cart to checkout and complete the purchase workflow without encountering errors.

ID	Title
C64	TC-CP-01: Verify user can proceed to checkout from cart
C65	TC-CP-02: Verify checkout page displays order summary correctly
C66	TC-CP-03: Verify user can complete checkout process successfully
