
FINAL TEST SUMMARY & CLOSURE REPORT

Project Name: Petstore Test-Case Execution

Application: Petstore Web Application

Application URL: <https://petstore.octoperf.com>

Testing Type: Manual Functional Testing

Test Management Tool: TestRail

Test Environment: Web (Google Chrome, Windows)

Report Version: 1.0

1. Introduction

This document presents the Final Test Summary and Closure Report for the Petstore web application. The purpose of this report is to summarize all testing activities performed during the project lifecycle and to provide a consolidated view of test execution results, key observations, identified risks, and the overall quality status of the application.

This report serves as a formal closure document that confirms the completion of testing activities and provides management-level insights required for release readiness evaluation and decision-making.

2. Testing Scope Confirmation

Testing activities were conducted in accordance with the approved Test Plan. The scope of testing focused on validating core functional workflows of the Petstore web application from an end-user perspective.

In-Scope Functional Areas

- Browsing pet categories (Bird, Reptile, Cat, Dog, Fish)
- Viewing product details
- Adding products to the shopping cart
- Updating cart contents (quantity modification and item removal)
- Checkout process and order flow
- Basic UI navigation and page transitions

Out-of-Scope Areas

- Performance and load testing
- Security and penetration testing
- Automation testing
- Backend and database validation

All planned in-scope features were covered during test execution.

3. Test Execution Overview

Test execution was carried out using TestRail as the primary test management tool. Functional test cases were executed on the live Petstore web application by following defined test steps and validating actual results against expected results.

A dedicated test run was created for functional testing, and each test case was marked with one of the following statuses:

- Pass
- Fail
- Blocked
- Skipped

Execution comments were added to capture observations and clarify test outcomes.

4. Test Execution Summary

The following summarizes the overall test execution results:

Metric	Count
Total Test Cases	29
Passed	19
Failed	6
Blocked	3
Skipped	3

Execution Overview

- A majority of test cases passed successfully, indicating that the core functionalities of the application work as expected.
 - Failed test cases highlight functional inconsistencies or unexpected application behavior.
 - Blocked test cases were primarily due to environment limitations or navigation constraints within the demo application.
 - Skipped test cases were not executed due to unmet preconditions or execution dependencies.
-

5. Key Observations

During the execution phase, the following observations were made:

- Category navigation and product browsing functionality are generally stable.
- Add-to-cart and checkout workflows function correctly in most scenarios.
- Some inconsistencies were observed in cart updates and navigation behavior.
- The demo nature of the application limits control over environment stability and test data persistence.

These observations were documented through test execution comments and reflected in the test results.

6. Defect & Issue Overview

Formal defect tracking was not implemented as part of this project. However, failed and blocked test cases serve as indicators of potential issues.

Common Issue Categories

- UI or navigation behavior not matching expected results
- Inconsistent cart updates
- Environment-related limitations affecting test execution

All observed issues were recorded through test execution statuses and comments in TestRail.

7. Risks and Limitations

The following risks and limitations were identified during testing:

- The application operates in a demo environment, which may introduce instability or unplanned downtime.
- Test data may reset without prior notice.
- Limited control over application configuration and backend behavior.
- Environment constraints may block certain test scenarios.

These risks were considered during result evaluation and reflected in the final recommendation.

8. Overall Quality Assessment

Based on the executed test cases and observed results, the overall functional quality of the Petstore web application is assessed as **acceptable** for demonstration and learning purposes.

Core user workflows such as browsing categories, viewing products, adding items to the cart, and completing checkout generally operate as expected. However, some functional inconsistencies and environment-related issues were observed, which would require further investigation in a production-level environment.

9. Final Recommendation

Release Recommendation

Conditional Go

The application is suitable for demonstration and non-production usage. For a production release, it is recommended that:

- Failed test cases are analyzed and resolved
 - Blocked scenarios are re-tested once environment constraints are removed
 - Additional testing cycles are conducted after fixes
-

10. Test Closure Statement

All planned testing activities defined in the Test Plan have been completed. Test execution results have been reviewed, documented, and summarized in this report. With the completion of this report, the testing phase for the Petstore web application is formally closed.
